Xiting Role Replicator
Xiting Authorizations Management Suite (XAMS)

XITING ROLE REPLICATOR

Xiting Role Replicator can help to significantly reduce the time and effort involved in the maintenance of organizational fields.

Using Xiting Role Replicator, role administrators can model the organization through so-called Organizational Sets (Orgsets), for example, based on geographic location, business unit or a combination thereof.

Once the model has been created, role administrators can assign template roles and then mass-replicate roles across all the other Orgsets.

Under the hood, Role Replicator creates single roles in PFCG and thus supports role concepts that do not rely on maintenance-intensive composite roles.

GOALS

- Simplify the maintenance of organizational fields.

- Easily replicate roles across organizational fields.

- Detect and prevent manual changes to organizational fields in PFCG.

Xiting Role Replicator for Orgsets

Role replication	Type	Orgset	Status	Synch.	Compare
Template role Z_DEMO_DEBITOR_DISPLAY				→	
Z_DEMO_DEBITOR_DISPLAY_B2000		SWITZERLAND	■	→	
Z_DEMO_DEBITOR_DISPLAY_B3000		GERMANY	▲	→	
Z_DEMO_DEBITOR_DISPLAY_BXXXX		CANADA	▲	→	
Template role Z_DEMO_KUNDEN				→	
Z_AMAG_TEST		XITING	▲	→	
Z_DEMO_KUNDEN_1000		XITING	▲	→

Keep Roles in Sync

Xiting Role Replicator also offers status reporting that show any roles in PFCG that are out of sync with the model. For example, if someone manually changed an organizational field for a role in PFCG, Role Replicator reports this discrepancy and offers a detailed analysis of the differences.

The role administrator then has the option to overwrite any manual changes with what is defined in the model.
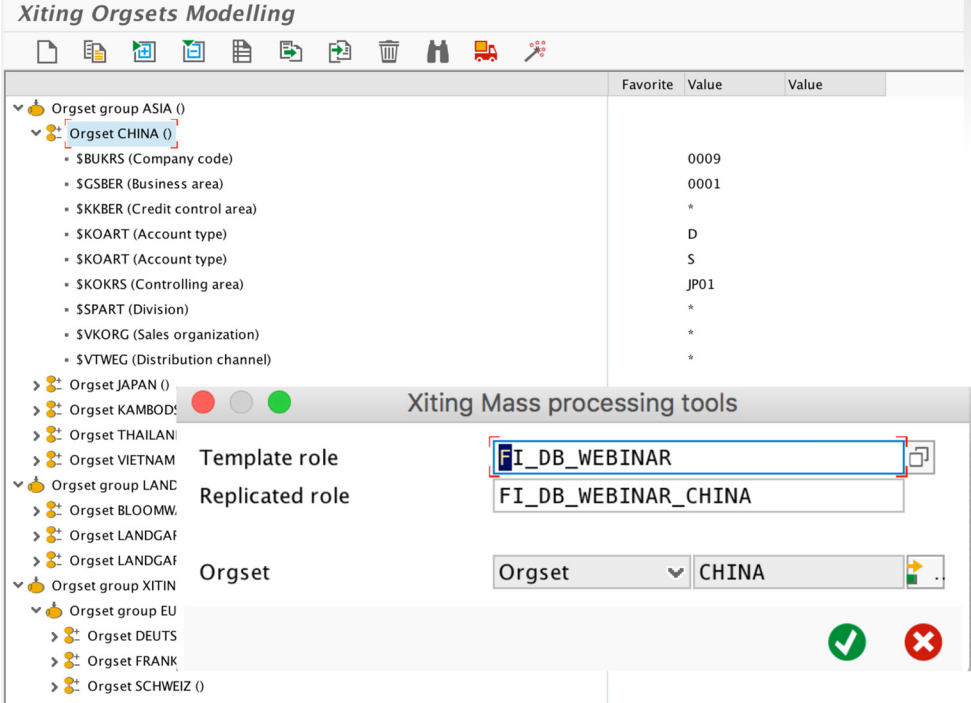

Simplify Org Field Maintenance

Should changes to organizational fields become necessary, role administrators can make the changes in Role Replicator before replicating them to all affected roles, by the push of a button.

Xiting Role Replicator not only reduces the effort involved in maintaining organizational fields, but it also prevents role quality from degrading through manual changes in PFCG.

KEY BENEFITS

- Reduce the effort involved in the maintenance of organizational fields.

- Conveniently mass-replicate roles across Orgsets.

- Detect and prevent manual changes to roles in PFCG.

- Includes role versioning and mass-processing capabilities.
