

# Xiting Security Architect

## Xiting Authorizations Management Suite (XAMS)

### XITING SECURITY ARCHITECT

The Xiting Security Architect provides ready-to-use security concepts that Xiting developed together with major auditing firms. Additionally, the Xiting Security Architect can compare your live systems with the provided concepts and report on discrepancies, long before your security audit is due.

With the Xiting Security Architect, you can generate, publish, and monitor your SAP Security Concept best practice at the push of a button. When combined with Solution Manager, you can manage your global SAP Security Concepts and compare them against connected systems.

#### Challenge

SAP security is a very broad and complex topic. New features are regularly made available by SAP and defining the best practices of which features to use, or settings to enforce, requires considerable experience.

That applies particularly to large system landscapes where global policies and minimum security standards are not only difficult to define, but they are even harder to monitor and enforce.

#### GOALS

- Create a comprehensive security concept, in the form of a document, which conforms to your security requirements.
- Keep your SAP systems up to date and in compliance with your concept.
- Automatically monitor your SAP systems based on the concept.

# **Security Architect** Xiting Authorizations Management Suite

With the Xiting Security Architect you can create an entire security concept (in the form of a document) by using best practice templates which are included and can then be adapted to your needs.

Check Mode helps you to compare your system's actual state with the target state. This process can be carried out locally for one system as well as from a central system (e.g. Solution Manager) for several systems.

Thus it is possible to test and monitor your system security configuration at any time and to save your test results. Compliance with the requirements can then be compared over time and tracked accordingly.

### Concept Templates

- SAP Security Concept for ABAP
- SAP NetWeaver Java (J2EE)
- SAP Access Control (GRC)
- SAP Solution Manager
- SAP Human Capital Management (HCM)
- SAP HANA

### Check Scope

- Authorizations
- Role Management
- System Security
- System Settings
- User Management

In contrast to manual creation, maintenance, and monitoring of a security concept, the Security Architect saves an enormous amount of time and resources.

### KEY BENEFITS

- Significantly reduce the effort involved in SAP security audits.
- Instantly check the compliance of your SAP landscape.
- Monitor progress and compare results for individual compliance reports.
