

XCSS - Xiting Cloud Security Services

■ SAP cloud adoption is rising!

Many companies are currently going through transformations into the cloud. They are frequently onboarding new SaaS solutions and BTP accounts that will replace or support existing business processes. In the resulting hybrid landscape, the right concept for managing the identity lifecycle and authentication for all users is a critical success factor.

■ Identity Access Management is a core element for operating secure hybrid multi-cloud landscapes!

Allows workflow-based user provisioning | SCIM and custom connectors | Supports various integrations with SaaS applications | Provides a central identity provider for user authentication with federation support | Supports secure authentication including MFA and single sign-on | Helps to find the right strategy for the claims-based authentication and authorization of users (SAML/JWT) | Integrates with existing IDM solutions, Azure Active Directory and other corporate identity providers.

■ Centralized user and authorization management covering compliance processes is a vital requirement!

SAP Identity and Access Governance to support capabilities like segregation of duties, re-certification, or business role management and more for SAP-based SaaS and on-premises applications.
