

SAP Fiori App Tracker

Assign SAP Fiori authorizations based on the least-privilege principle!

Do you want to know which Fiori applications are being used in your SAP Fiori Launchpad, by whom and how frequently? Currently, there is no built-in app tracking feature in the SAP standard, and the ST03N data can only partially serve this purpose.

The **SAP Fiori App Tracker**, which is the latest feature of the **Xiting Authorizations Management Suite**, can help you assess the usage of your SAP Fiori applications and eliminate unnecessary over-authorizations.

- 1 **Activate Odata Service & ICF Node**
(simple configuration)
- 2 **Tracking possible at user level**
(records in the background which app was used)
- 3 **Assign authorization role for App Tracker**
- 4 **Central log for analysis**

More transparency for your SAP Fiori authorizations

- Identify necessary SAP Fiori applications using the **SAP Fiori App Tracker** from Xiting
- Integrated app tracking and simulation of backend roles enable you to develop an audit-compliant authorization concept.
- Full integration with the **Xiting Authorizations Management Suite (XAMS)**
 - Coverage analysis (used vs. authorized and the degree of coverage of roles)
 - Compliance checks
 - Automated role creation for SAP Fiori authorizations
